Pioneer in Sustainability

The complete range of HVAC solutions for your business:

- SALES
- SERVICE
- SPARES
- CONTROLS
- RENTAL

Innovative products and services

Over 100 years ago Carrier helped pioneer a new industry, and in the last two decades we have pioneered environmentally sensitive products with a reduced impact on the environment. We recognise that there must be a responsible balance between the technology we provide today and the world we will live in tomorrow.

Preservation of the environment and protecting our finite natural resources is a central tenet of our business.

We have consistently demonstrated our adherence to these values by creating environmentally sound products that consume less energy and incorporate innovative materials.

We are committed to reducing the greenhouse gas impact of our products through energy efficiency advancements and the refrigerants we use.

Carrier is leading the industry in the phase-out of ozone-depleting refrigerants and has introduced many of the world's most energy-efficient heating, air conditioning, and refrigeration systems.

Today Carrier continues to improve the environmental performance of products, services, operations and culture to help achieve a sustainable society and protect the natural environment for generations to come.

Innovation

Throughout the world Carrier offers a wide choice of products and systems designed for years of reliable and trouble-free operation. Due to their reliability and longevity, the energy efficiency of our products becomes part of our customers' environmental footprint.

This motivates us to design for the environment, creating products that consume fewer resources and produce fewer emissions during manufacture and operation.

Technological Advancements

As the world leader in high-technology heating, air conditioning and refrigeration solutions, we are devoted to the advancement and application of the latest technologies. More than 2,000 scientists, engineers and technicians at research and design centres worldwide work to apply the newest technological innovations to the practical needs of millions of customers.

Improved Equipment Efficiency

With the increased focus on reducing energy consumption in buildings and related CO₂ emissions, Carrier continues to improve equipment efficiency and employs an integrated system approach for the highest overall savings.

Understanding Whole Building Needs

Air conditioning, heating and refrigeration systems require energy to operate, usually electricity or natural gas. Heating, cooling, refrigeration and air conditioning account for around 40-50% of a typical building's energy usage. We continually invest in research and development to expand the cost-effective energy-efficient range of our products. We do this because buildings consume about 40% of all energy worldwide. In nearly every product category, we offer industry-leading, energy-efficient options for our customers.

Reduced Energy Consumption

Whatever type of building and whatever the application, from commercial buildings, office applications through to industrial processes, Carrier offers a wide range of solutions to meet customer needs – integrating comfort, performance and rationalised investment aspects.

Carrier's energy service operations have implemented more than \$2.5 billion in energy savings at more than 2,000 sites, while our green building consulting services have helped the world's largest companies and organisations, including the Beijing Olympic Village, achieve Leadership in Energy and Environmental Design (LEED) certification.

Sustainable Refrigerant Solutions

Customers look to Carrier to develop sustainable solutions for refrigerants, especially given climate change considerations. Carrier leads the market in innovation and design of equipment using the latest refrigerants. We keep pace with and anticipate the changes driven by legislation in response to global warming to reduce energy consumption and the environmental impact of our products.
